Letters

Two new User Groups — a routine to change the cursor shape — questions about the Dragon Plus add-on — Back issues.

People's Chart

Vote for your five favourite Dragon programs, dream up an entertaining program, and win £25 in software.

News

Winter Eclipse-Fanner? — new games software on the way — 6809 Christmas Show details.

Communication

Send in your questions, if we can't answer them, maybe we can find someone who can.

Dragonsoft

Twoyoung are (well, fairly) — Ruby Robbs and Superboy! — and a golden older, Laser Zone. We know Doy Orbanum has some weird habits, but is he getting in too deep?

Show Report

Roy Coates, who should be at home writing some more games, reports from the John Parn Dragon show at Chiswell Town Hall, where he saw some new software.

Machine Code Tutor

After a month's absence, Meers, Orbanum and Campbell proceed with flags, branches and a pot-pourri of further instructions.

Dragon dialects

Beginning a new series on language alternatives to Dragon basic, Brian Cadge looks into Pascal.

Dragon Answers

We have the answers — on data graphics storage, disk interfacing, and DelatDOS, — but what are the questions?

Screen Designer

Use all the Dragon's graphics and text facilities to design, save and display custom screens.

Sound Ability

A set of routines to make the most of the Dragon's sound capabilities — which are larger than you might think.

Sliding Graphics

Pam D'Arcy uses her basic to write a non-arcade graphics game, and explains the techniques as she goes.

Arcade Arena

Not only a map of The Dark Pit but a listing to save Total Eclipse game. We haven't tested it. This is live polishing!

Adventure Trail

Mike Gerard with problems and solutions, and a closer look at Aquanaut 471.

Competition

Lots of little puzzles this month but you need only solve one of them to win the prize.

11

SUBSCRIPTIONS are still pouring into Little Newport Street, to the delight of everyone except poor Anne Marie, who has to enter all the details. Suggestions and opinions have also been pouring in. A few people who are short of money are worried about losing touch. Help your fellow Dragon-users to stay in touch by carrying the latest issue in your back pocket and whipping it out wherever Dragons gather — back issues will be available, and new subscribers are welcome at any time.

The special offer of £12 for a year's subscription continues this month, so if you know someone who missed the June issue — draw it to their attention.

This month DU begins a new series from technical maestro Brian Cadge on language alternatives to Basic, starting with Pascal, and we re-join Orbanum and Campbell in their epic trip into machine code, with a double helping to make up for last month's dearth.

We depend on your feedback, so write and tell us what would be useful.

How to submit articles

The quality of the material we can publish in Dragon User each month will, as every great editor depends on the quality of the discoveries that you can make with your Dragon. The Dragon computer was launched on to the market with a powerful version of Basic, but with very poor documentation.

Articles which are submitted to Dragon User for publication should not be more than 3000 words long. All submissions should be typed. Please leave wide margins and a double space between each line. Programs should, wherever possible, be computer printed on plain white paper and be accompanied by a tape of the program.

We cannot guarantee to return every submitted article or program, so please keep a copy if you want to have your program returned; you must include a stamped, addressed envelope.

Letters

This is the chance to air your views — send your tips, compliments and complaints to Letters Page, *Dragon* (Sec. 12-13 Little Newport Street, London WC2H 7PP).

More to come

I WAS disappointed to hear that the mag is going subscription only, but I understand your reasoning, and it's better to pay £12 in one go than not to buy GU at all!

I hope that your promise to 'back even more in' means more pages.

Would you please give our following to articles on the following: Use of Diagnostics (the manual is just about useless); adding a second disk drive using one of the many cheap drives now available; CDSPI Drive (especially an article by Computerist); identifying (to robots etc) and more technical details on the hardware and circuitry.

D. J. Barkham

New Broughton Green
Northampton NN2 2TG
PS Any idea where I can get hold of a copy of the D59 operating system? I'm getting desperate.

We would like some more news on the D59 system ourselves. Can anyone assist?

Useful programs

OVER the years I have developed a number of small utility programs which I have found very useful. They include an easy-to-use load and search program, a program to auto-run and partially protect both BASIC and M/C programs — this includes a load screen designer, a program to enable you to make copies of your own auto-run programs, a Merge program for easy merging of Basic programs, a List program which by listing online at a time and providing easy movement up and down etc, make listing easy, and a full 6809 disassembler for the Dragon.

If any of your readers would like a copy of these programs plus instruction sheets I would be glad to send them one. They should either send a tape, size and 17p stamp to

cover photocopying or their address plus £1 to cover anything.

44 Salford Road
Widmer
Dorset
Barn

Add on Colour

AFTER reading the review of the Dragon Plus in the January 58 GU I had the impression that unless one has a disk drive and wants to use Plus this expansion is of no use. Is this correct? In relation to graphics, does anyone make an add-on that will give colour in PMode or? The Dragon Plus gives 80x24 display, what effect does this have on the graphics?

J. E. Smith
35 Bewick Crescent
Newton Aycliffe
Co Durham DL2 5LJ

Computerists are the agents for Plus only, so they don't sell CDS. They don't do cassette-based systems either, so their own software is written around the requirements of Plus; there is no software on the board itself — if you can obtain suitable software control, you can hook it up to any system. The Dragon Plus does not alter the graphics capabilities, being a text-only display.

Well Done!

I AM writing to GU to say thank you to all the staff who helped get many a delayed copy of *Total Eclipse*. Without their support many readers might not have known who to contact. I hope you print this, so that people can see, that without GU, the Dragon just could not survive.

S. Moorfield
14 Clarendon Road
Great Blunston

Cambs PE17 5AL

New Shape

IN RESPONSE to L.M. Martindale's query as to whether or not the Dragon 50's cursor could be made to change its shape, I have written this small routine to do just that:
10 FOR X=54022 TO 54015
20 READ AS
30 POKE VAL("M"+AS)
40 NEXT X
50 DATA 88, 82, 86, 87, 91, 88, 88, 78, 87, 87, 84, 79, 74, 72, 90, 86, 88, 74, 87, 84, 78, 82
60 GOTO 110

Enter the program and RUN it. As it stands, the program changes the cursor to a letter 'M', but can be altered by typing: POKE 54011,ASC ("your character").

Dragon Society

I WOULD like to let Dragon User readers know about a user's group I have started. It is called the Dragon and Co-Co Users Society. Members will receive a quarterly newsletter that offers hints and tips, answers to members' queries, program listings and a chance for members to get in touch with each other. Anyone joining will receive a machine code utility, to auto-run their own programs.

Membership is £1.80 a year and further information can be obtained from me at the address given.

Kevin Coleman
804 Evesham Road
Gower
Kent CT17 3JN

Correct Tips

IN THE April edition under "More Tips" there were two mistakes. The first line should

read:
28 FOR A=1 TO 18
The second was line 48 and should read:
40 SWRITE 1, 20, A, AS, 88
R. Baker (04777)
52 Princess St
Chesham Terrace
Staffs W20 6JN

Amateur Radio

I AM writing to advise you that I am engineering a Dragon Amateur Radio User Group. This group will cater for licensed and listener radio amateurs and will explore the capabilities of the Dragon (both 32 and 64) in the field of amateur radio to the full. Having seen the letters following Martin Worscott's letter, I would like to say that this group will be specialised and devoted solely to amateur radio with the Dragon. I would be grateful if you would publish this short letter and anyone interested should contact me at the address below. We have already published two newsletters and the third is due out in July. The subscription is £3 per annum.

Back Copies

WHERE and how can I buy older back issues of GU? I mean from 1984-1985.

Lots of people

We normally only have back numbers for the last six months, although if you're lucky you can find a few older issues. We ask £1.25 post paid per issue.

We can supply photocopied articles from some earlier issues for £1 per article, irrespective of length.

If we can't supply the issue or article you ask for, your order and money will be returned.

News desk

If you have any new products for the Dragon — software or hardware — ring the News Desk on 01-637 6342

Sun starts to shine for Eclipse?

TOTAL ECLIPSE, the vast space trader game which ran into problems on its maiden voyage, looks as though it's coming out from behind the cloud at last.

Eclipse-Ferraris chief Trevor Davies believes that every customer who contacted the company has now been sent the mark 1.3 version of the game, free of the elusive bugs which had stopped play. "To the best of my knowledge, there's nobody out there who hasn't received a game, or ordered one. The Birmingham

Consumer Services Department put one more chip through to me this week."

"We were quite surprised at the public's reaction. They have stuck with us. People who are really unhappy at the time have contacted us to say how pleased they are."

"It has taken time to deal with mail because we had to let some of our staff to go, and the office is not running full time. We also lost some mail because of this. It has really knocked us for six. I put money into it and went to over the top."

"People have asked us about our next game. We are contemplating another game, but it will take us a while to get back on our feet."

Birmingham Consumer Services confirm that Eclipse apparently has it sorted out. They're not fly-by-nights, and I know they've been making efforts. They are still based at the same address."

The address, for anyone with further queries, is Eclipse-Ferraris, Suite 10, 4 Orphanage Road, Birmingham B24 8HS.

Total Eclipse, topped as game of the year by DU's reviewer before the troubles, is available from Eclipse-Ferraris at £9.95, or win one in this month's Golden Line puzzle.

Prize Books in lieu

MELBOURNE HOUSE, who have been making efforts to find a few of the last remaining *Dragon* The Dragon tapes for Dragon User's outstanding January prize-winners, have contacted us with the sad news that nobody they have spoken to has a spare tape under the counter.

Melbourne House send their apologies to all concerned, and those winners who did not receive tapes will be getting books in lieu.

Text Adventure

A NEW classic-style text adventure running under the FLEX DGB is on its way. The Curse of Conan boasts 108 locations and 28-plus characters in 47% of machine code

plus 10k in the utility-oriented space on disc. The program has a large vocabulary, and FLEX commands can be used during the course of the game.

Look out for a review from Ray Coates soon. The Curse of Conan can be ordered from R. Hunter, 46 Greenall Road, Glen, Bus, Lancs BL8 5LL, for £10 post paid.

Radio Amateurs impress Blaby

BLABY had two new games with us now and another on the way, so look out for reviews next month. Temple of Doom, Boulder Crash and Train are the names to watch out for.

"The Dragon show in Manchester was very successful for us" says John Bailey. "A comparatively small number of people came, but they're all serious Dragon people." John was impressed by some practical demonstrations of Dragon programmes being used by Radio Amateurs to send pictures by RTTY.

Dragon User would like more information on Amateur Radio software for the Dragon and Tandy micros, so if you

Temple of Doom

Boulder Crash

have anything to say on the subject, drop us a line.

68 Micro Group

ANY solitary hardened Dragon or Tandy CoCo hackers might be interested to hear of the 68 Micro Group — an established national club dedicated to users of all 68xx systems.

Membership includes a nicely put together 45-type journal (named 68 Microcom), access to a library of assorted software (much of it FLEX and C64-8) and, of course, contact with other en-

thusiastic users. Pressing the April edition of 68 Microcom showed it to be 30 pages packed with assembler and circuit diagrams, special hardware offers (now about £8 quid for a Modern 2002, direct Modern House!) — with four pages devoted to the Dragon fleet.

Although perhaps not for new beginners, this ambitious

group (they plan to hold nationwide monthly meetings, where therein the support) is certainly worth investigating. For membership details, write to Jim Turner at 63 Mills Road, London, E11.

Xmas Show

MICROGAL'S 6800 CHERRY-BAG Show will be held on 22 November at the Royal Horti-

cultural Halls, Westminster, London. For more details phone Jenny Pope on 0726 0820. The Royal Horticultural Halls are within easy walking distance of Victoria Station, British Rail, and Victoria and St James Park underground stations.

Microdeal have two new games in the pipeline: Cuthbert and the Golden Chalice, and Tanglewood. No release date yet, but we hope to be releasing these as soon as they become available.

Communication

Send in your questions, requests, and pleas to Communication, Dragon User, 12-13 Little Newport Street, London WC2

Problem: I want to meet any Dragon owners in the South-ampshire area, as I own a Dragon 32 but don't know anyone else who does.

Enquirer: Jason Coombes 52 Springfield Avenue, Holbury, Southampton SO4 1LP.

Problem: Started "text on lines screen" MC routine for adventure program under Comand DOS. Can anyone help?

Enquirer: J. D. Lee-Green, 1 Whiteharts, Reading, Leeds, W, Yorks LS19 6BW.

Problem: I have Cumbert in Space and I used the jokes (D2, March 1986) but I still get only four lines. Help. Also I would like a Dragon owner penfriend, preferably in the Gloucester area.

Enquirer: Paul Palmer, 10 Underhill Road, Matson, Gloucester GL4 9HB.

Problem: I have a Dragon 32 with a Star Gemini 16 printer. I cannot follow the instructions for printing graphics. They read as follows: PERMAN

CHRB(1) CHRB(7) CHRB(1) CHRB(2) CHRB(1) CHRB(2) ... The

number of columns to be printed is given by 1 + 256/n. There must be an 256/n characters following 22, so far I have failed to work out any combination of figures to give me a print out. Could anyone explain? Preferably with an example.

Enquirer: D. S. Henderson, Cambria, Larnes Cliff, Tottwood, Dorkham, Norfolk NR19 1LE.

Problem: I have a Dragon 32, and have some difficulty writing a program for dumping screen graphics, graphics, etc. to hard copy. I have a Brother

1006 printer. Any help would be most welcome.

Enquirer: J. Avey, 1 Savoyard Avenue, Glasgow, Hants PO12 2SS.

Problem: I have written a program that scrolls the screen to the left. The sprite is spaced out which should move up and down, left and right, using peak keys, leaves a tail behind. Could anyone give me a program to go in Basic to remove this problem?

Enquirer: H. Widdowick, 131 Penstemon Road, Gnosdown, Sheffield, S20 3DH.

Problem: I have owned a

Dragon 16 and disk drive for a year with no problems. Recently an intermittent fault has developed in my system. The symptoms are that when I type any DOS command I get an error, eg DIR or LSAD or BF error and BCCOT for D59 an BF error. The disk motor is working. I have checked my disks on another system and they are all OK. Could anyone let me know if they have had a similar problem, and do they suspect the DCS or the drive?

Enquirer: Peter Duncombe, 8 Arden Close, Haspenden, Herts AL5 4SL.

Communication

Stuck for a solution? Need some obscure equipment? Feeling out of it? Fear not — someone, somewhere can help you! Write down your problem on the coupon below (make it as brief and legible as possible) together with your name and address and send it to Communication, Dragon User, 12-13 Little Newport Street, London WC2H 7TP. We'll publish it as soon as we can — meanwhile, maybe there's someone you can help this month!

REAL VALUE FOR MONEY SOFTWARE

Bowled out

Program: Superbowl
Supplier: Compimage (Name by Cable)
Price: £2.99

LO, life in the happy land across the waters had fallen upon even harder times than when last we told of it. With the general disenchantment among the little folk with the great witch Cateletta and her foiled blessing in Zak's favorite little folk had just away their Dragons and plucked a normal world in the back of their little television and a new crisis had befallen across the land.

For surely whilst the people discovered Channel 4 and found how very different it was and exciting with programs of alternative arts, and minority groups, their own programs (which did taste the

hearts of the hobbits in the land) who up until then had been given a fairly hard Press by Meltcombe (House), and alternative sports.

They were Basketball and American Football. But soon the cricket club die out for basketball, as the little folk had not the height to get the ball in the basket and so American Football became the craze.

And high in his castle among the dark mountains the evil wizard didst laugh and count his money as he did control all of the sport steadily wins all at once and then laugh a lot more for he had freely removed all the Dragons from the land (for it he did hate computers as much as happiness).

So, as you can see, things looked pretty damn bad for the little people. But then the good witch Cateletta didst back it and released a game based upon American Football, which shows a top view of players running up and down the pitch

and is generally a great idea. Sadly though, the good witch had had much of her energy sapped by the defeat of

Zak's son by the evil wizard and so all she could produce was a game with nice smooth graphics but little else.

And so, once again the little people didst send off for it and get all their Dragons out, and feed it up, and play it for a

couple of nanoseconds, and get bored out of their wits with it, and put their Dragons away again, and throw away the game, and go back to watching alternative arts programs.

And the good witch Cateletta was terrified from the land for letting the people down again. And the Dragons didst never come out again. And again his came the evil wizard laughed that all this had gone so well for him when he'd really had nothing to do with it. And he didst come forward and crown himself king, and his name was Cliff Slewake.

And the morals of this tale are firstly that if no one gets their A into G about producing software then computers die, and secondly those who bring out too rubbishy games in a row can't complain about too cynical reviews.

Jason Chisum

Old zoner

Program: Laser Zone
Supplier: Microdeal
Price: (See text)

A FEW YEARS ago, when I was very young, I went round to my mother's house to see a couple of new games he had acquired for his VIC-30. One of them was Laser Zone. My played it all evening and I spent hours in incredible envy of this game.

I can't remember why I loved this game so passionately, but it's still a good game, only as down by the graphics on the Dragon. I put you on two axes of a grid with objects coming at the two axes. On each axis you have a gun and the idea is to blast anything that moves out of the sky (or grid). Up and down on the joystick controls the gun on the vertical axis, and left and right correspondingly move the gun on the horizontal axis. And that's about it, save a couple of other nifty touches that take this game from the mediocrity.

The first is that by using diagonal movement it is possible to pick an alien that has landed on a certain axis off with the other gun (does that make

sense?) This is a very difficult manoeuvre to execute involving a lot of practice to prevent suicide!

The second is that it is possible to play with two people in co-operation, one on each axis, and it's here that the game comes into its own.

The sound's great, the graphics are all right (although

I prefer black and white) and it plays fine. I have given it a rating of three but I don't know whether I found the game a lot more because it had not translated well to the Dragon, or because after a very long wait I had built up my expectations too highly, so it may be worth four.

The game is well worth a

look if you can pick it up cheap somewhere (it's often going cheap at the shops) and you may find the initial pressure for it that I shared. But, be warned, this is not an easy game!

Jason Chisum

Hooked

Program: Ruby Rabbit
Supplier: Batty
Price: £1.99

IT HAD BEEN a bad day, outside the rain was pouring like it would never stop. Dad knows how long I'd been on this case. I thought it would never end. Armed guards, snakes, and rules. They all swirl round my head like it was some sort of aquarium.

I threw on my coat, missed, tried again, missed again, and then put it on properly. I'd never managed to learn that trick, I sighed.

She sat there when I opened the door. A real picture of beauty. "You've got to help me!" she said. "I can't stop playing Ruby Rabbit." I sighed. Knew the symptoms, my God, I had them too.

"You want a drink?"

No reply.

"I'll get you a drink," I said. I sighed. I seemed to be doing a lot of that recently. I fixed her a gin. But when I got back into the room I found that all that was left was a faint memory of her perfume and a cassette inlay on the floor. I read it. "The object of this game is to steal the precious Ruby by breaking the complex defense system guarding it."

There they were, the same old instructions. I went to the cupboard and opened it. Out fell thirty thousand Ruby Rabbit cassette tapes. There were thirty thousand others out there who were addicted.

Then I found a card. I decided to follow it. It led to a plug stuck in a socket on the wall. Delicious. And typical of the enemy. Batty. That one word struck so much terror into the hearts of so many people. Batty. For some it meant

sheep games. But for most it meant addiction. I decided to follow the lead the other way. . . . It led to the cassette recorder connected to my Dragon.

I sighed and loaded up the game. It loaded fast with no problems. The graphics were smooth and flicker free. The sound was great. I knew there was a connection between this and the Batty's Gold case that had so nearly cost me my life. I had to play. I sighed. I sighed. I sighed again for good.

I sighed. Maybe the case was unattractive. Maybe the game was too addictive. I looked at the screen. The blue light on the portable was all that in the apartment. I sighed, and settled down to another night's play.

Jason Chisum

What a wonderful show!

Roy Coates at Oseff.

THE SECOND of the John Peen Dragon shows was held at Oseff Town Hall last weekend the 31st May. At first thought this seemed to be an odd choice of venue although after consulting a map it proved to be well thought out as easy access is gained from both the M62 and M1 motorways. This was borne out by the fact that there were actually people waiting outside before the show started.

It was nice to see a few new faces as well as most of the regular suppliers of Dragon hardware and software in attendance with some marvellous bargains and a very large selection of both programs and accessories for the Dragon.

Firstly (and deservedly so), John Peen had a large and well manned stand offering unbelievable discounts on a comprehensive range of software which included both games and utilities on both cassette and disc. Compuserve as always, were displaying their extensive range of both hardware and software, most of which centres around the RLEK and OS-2 operating systems, which, judging by the amount of people gathered around their stand was generating some real interest. Ted Ojhrchal from Compuserve was keen to stress that they are still very much dedicated to the Dragon and will be continuing to support the Dragon users as long as they exist.

Blaby (as usual) were very busy demonstrating their vast range of games software with two new releases on show, Boulder Dash and The Temple of Doom with the promise of more new titles to be released shortly.

Eclipse-Farmer were again displaying their Total Eclipse program and now seem to have come through their initial bad publicity problems simply through having such a very high quality game. For those of you that have been brave enough to tackle Total Eclipse, I have been informed that there is a third universe to be released shortly which must make this game possibly the longest playing adventure ever written for the Dragon. Good old Peaksoft were again there to tempt us with a huge range

of accessories on show including everything from replacement power supplies through disc drives to sweat shirts. Although they do not supply software for the Dragon they probably have the largest stock of accessories for the Dragon.

Computas, which is one Dragon company that seems to be rapidly expanding, has a most comprehensive range of software at ridiculously good prices and a running battle seemed to be constantly in progress to get near enough to their stand to buy something! I must confess that they had

units as well as other software of specific interest to the amateur historian.

Microvision had Beanzister on display as well as representing Incentive and Software Projects by displaying Moon Cresta and Jet Set Willy.

What made this show different from previous ones were the stands that weren't actually selling anything but which were demonstrating how they used the Dragon for a specific application. These nice amateurs (OGA12, GATOR and GAZZ) had set up two Dragons at opposite ends of the demonstration hall and

from St Albans came to demonstrate how they have been using Dragons to assist in the excavating of a Roman cemetery in St Albans, the software that they have developed is very impressive and allows the accurate mapping of the graves to be excavated and also the comparison of various sites to be made by either displaying multiple maps on the graphics screen or by overlaying one on top of the other. Similar programs have also been written to allow for the precise measurement and comparison of the ceramic pots which are common to this type of site.

One of the stands had been taken by a young programmer who was exhibiting his software in the hope that it may be taken up by a software house. One of the packages that I looked at was the Composer Companion which co-reads with Microcalc's Composer package and allows musical data entry to be made via a musical slave as opposed to those awful DATA statements that make data entry and correction an appalling job. If you are interested, contact Jonathan Cartledge of Stanish Software, 25 Tintern Road, Chesham, Herts, Chesham SN8 7DP.

A lot of visitors to the show were bemoaning the fact that there is very little software available on disc. Having spent a long time on audio systems it is rather galling when you find that you can't use it. Maybe we shall see more disc based software from now on?

From an exhibitor's point of view, one thing that struck me was that all the exhibitors seemed to know each other well and the atmosphere was a very friendly one as opposed to a competitive one. The relationship between them being more like a family instead of a business.

In conclusion, the show was a great success judging by the smiles, and each of the Distributors that I spoke to had the same thing to say, "What a wonderful show!". If I have missed anyone out, my apologies, it wasn't been intentional but the show was busy and it was difficult to get around everyone.

many Dragon titles for sale which I for one had never heard of before as my wallet certainly went home relieved of some of it's burden!

Amateur Computing were showcasing off their new monthly magazine for the Dragon called Dragon Monthly, Imperious title etc's, as well as their Electronic Author and Gordon Bennett programs.

Granvener Software had an impressive display of goodies on show which included the 'Ocean' range of programs which consist of assemblies, disassemblers, word processors etc, etc, as well as their products to keep the amateur radio enthusiasts happy with RFTY units, Slow scan TV and the software to support these

were communicating between them using a radio link on the 2 metre FM amateur radio band, with great success. What wasn't obvious was that the software is available to the general public, if you are interested contact Blaby's John Balles who is himself a licensed radio amateur (G11LT). The Dragon does seem to have become almost a 'vill' machine with radio amateurs all over the country and there are many groups who are sending software via radio on a regular basis. You do not have to be licensed to receive these transmissions but you will need a receiver capable of tuning in the VHF range at about 144MHz.

The Venturian Museum

Flag And Branch

Part Five of our machine code series — Jason Orbaum waves the flags.

HELLO, yes, it's me, alone again — this month talking to you about the CC flag and Branch instructions. You'll have to forgive me if I wander off the subject, it's just I'm missing Geoff and, if he's reading this, come back. And bring the disc drive with you!

First, a big thank you to a certain Mr Martyn J. Preston who, writes to inform us all of where we can get the elusive Motorola specification sheet on the 6809. Apparently in the Hitachi Semiconductor Data Book — A 70 pin Microcomputer there are about 30 pages on the HD68090 and the HD6809 as well as data on the 68xx and 68xx micro-processors and other peripheral chips (6801, 6840, 6850, etc). There is also, according to Martyn, some information on the HD68090. Martyn got his book from Farwell Electronic Components Limited, Casar Road, Leeds LS12 2PU. The stock number for the book is 171-360 and it should cost £7.50. Thanks again for that, Martyn.

So, on to the business in hand. This month, after last month's rather simplistic article we have aimed slightly higher. If you find the information laid out simply to a degree or you still find it too simple to read, please write and let us know at the usual magazine address.

Below is a dissection of the CC flag into its respective bits with descriptions of those immediately relevant.

The CC Register

C : E : F : H : I : N : Z : V : O :

C: Half Carry

This bit is set (contains a value of 1) when the result of any mathematical calculation results in the fourth bit of the resulting byte being set. This will become clearer after next month's tutorial on additional instructions.

N: Negative

This is pretty obvious. The bit is set if the result of a mathematical operation should be negative.

Z: Parity

Set on equality, ie if the two elements of a CMP instruction are equal the Z bit will be set.

V: Overflow

Set if the result of an eight bit operation mathematical operation. This is the way that negative numbers are detected in binary. Next month's rather lengthy article will explain both Z's complement and BCD notation in binary. It was decided after last month I would be better to give them a miss this month and steer off the theory back into the commands and practices.

C: Carry

Set if the result of an eight bit operation causes the need for a ninth bit, ie $111111110 + 10 = 1000000000$. The result, as can be clearly seen, has nine bits. The ninth bit becomes a set carry bit in CC and the byte becomes 00.

These three, for the moment, are the important bits in the CC flag. Let us now give their relevance to the branch instructions. The branch instructions covered here are not all of those in this month's table. However, they are the only ones you will need for now. I shall use the current situation with me and Geoff as an example for illustrative purposes.

BCC: Geoff comes back if and only if it's on his terms.

BNE: Geoff comes back provided it's not on his terms.

This pair, as can be deduced, stand for Branch if Equal and Branch if Not Equal, they are used after arithmetic calculation (as are most of the branch instructions). **BLO:** Branch if Lower: Geoff comes back if he agrees to drink less.

BLE: Branch if Less than or Equal to: Geoff comes back if he agrees to drink NO MORE than he did before.

BHI: Branch if Higher: Geoff comes back if he agrees to give me more spirit than before.

BHS: Branch if Higher or Same: Geoff comes back if he agrees to give me NO LESS spirit than before.

BHN: Branch Never: Geoff never comes back.

BRA: Branch Always: Geoff always comes back.

Quite quick and painful really, wasn't it? The idea is that you take this, look at the table of branch instructions, match them up, and then look at the following piece of code and work out at which lines the code will RTZ for

the numbers given.

```
10 LDA #RM
20 CMPA #0
30 BEQ POINT1
40 CMPA #50
50 SHS POINT2
60 CMPA #32
70 BLO POINT3
80 SUGA #32
90 BEQ POINT4
100 BHN POINT5
110 RTS
120 POINT1: RTS
130 POINT2: CMPA #200
140 BLO POINT5
150 RTS
160 POINT3: RTS
170 POINT4: RTS
180 POINT5: RTS
190 POINT6: RTS
```

The MV in line 10 stands for a number given from the following list. Work out where each takes the program:

100, 32, 33, 0, 232, 233, 260, 190, 50
The answers, respectively, are the following lines:

100, 170, 110, 120, 150, 150, 150, 190, 190

If you got the exercise correct then you can congratulate yourself on passing the most, but complex part of the course. And that really is it for this month. Next month Geoff gets back from holiday (yes, all that stuff about him leaving was a big joke, and boy, it's going to be a funny when he sees it in print) and to celebrate we'll be presenting an extra long edition. So, for those of you who like to read up ahead of us next month the following interesting and varied topics will be covered:

- (1) Assembly directives (maybe, we've been promising this one for so long now that it's almost fun to not do it this month)
- (2) The differences between LSRD and SHS and other related topics, which leads nicely into
- (3) Addressing modes
- (4) Arithmetic, complete with diagrams and tables
- (5) BCD and 2's Complement arithmetic. All this and more that you will hardly believe or understand. (Gee lots of interest!)

Branch Instructions

BCC — Branch on Carry Clear

Mnemonic: BCC & CBCC

Function: If C=0 then branch to specific point

Addressing Mode: Relative

BCS — Branch on Carry Set

Mnemonic: BCS & CBCS

Function: If C=1 then branch to a specific point

Addressing Mode: Relative

BEQ — Branch on Equal

Mnemonic: BEQ & CBEQ

Function: If Z=1 then branch to a specific point

Addressing Mode: Relative

BGE — Branch on Greater than or Equal to

Mnemonic: BGE & LBGE

Function: If (N XOR V) = 0 then branch to specified point

Addressing Mode: Relative

BGT — Branch on Greater Than

Mnemonic: BGT & LBGT

Function: If Z and (N XOR V) = 0 then branch to specified point

Addressing Mode: Relative

BHI — Branch on Higher

Mnemonic: BHI & LBHI

Function: If (C or Z) = 0 then branch to specified point

Addressing Mode: Relative

BHS — Branch on Higher or Same

Mnemonic: BHS & LBHS

Function: If C = 0 then branch to specified point

Addressing Mode: Relative

BLE — Branch on Less than or Equal to

Mnemonic: BLE & LBLE

Function: If Z or (N XOR V) = 1 then branch to specified point

Addressing Mode: Relative

BLO — Branch on Lower

Mnemonic: BLO & LBLO

Function: If C = 1 then branch to specified point

Addressing Mode: Relative

BLS — Branch on Lower or Same

Mnemonic: BLS & LBSL

Function: If (C or Z) = 1 then branch to specified point

Addressing Mode: Relative

BLT — Branch on Less Than

Mnemonic: BLT & LBLT

Function: If (N XOR V) = 1 then branch to specified point

Addressing Mode: Relative

BMI — Branch on Minus

Mnemonic: BMI & LBMI

Function: If N = 1 then branch to specified point

Addressing Mode: Relative

BNE — Branch on Not Equal

Mnemonic: BNE & LBNE

Function: If Z = 0 then branch to specified point

BPL — Branch on Plus

Mnemonic: BPL & LBPL

Function: If N = 0 then branch to specified point

Addressing Mode: Relative

BRA — Branch Always

Mnemonic: BRA & LBRA

Function: Branch to specified point

Addressing Mode: Relative

BRN — Branch Never

Mnemonic: BRN & LBRN

Function: Branch nowhere ever! (This is only included for symmetry.)

Addressing Mode: Relative

BSR — Branch to SubRoutines

Mnemonic: BSR & LBSR

Function: Branch to specified address leaving present location on system stack S

Addressing Mode: Relative

BVC — Branch on Overflow Clear

Mnemonic: BVC & LBVC

Function: If V = 0 then branch to specified point

Addressing Mode: Relative

BVS — Branch on Overflow Set

Mnemonic: BVS & LBVS

Function: If V = 1 then branch to specified point

Addressing Mode: Relative

JMP — Jump

Mnemonic: JMP

Function: Jump to specified point

Addressing Modes: Extended

Direct

Indexed

JSR — Jump to SubRoutine

Mnemonic: JSR

Function: Jump to subroutine at specified point leaving current address on system stack S

Addressing Modes: Extended

Direct

Indexed

Addressing Modes

Part six follows fast, with Geoff Campbell on the spot.

JASCH presented a piece of prose designed to explain the intricacies of the various Gforth instructions, and I fear one thing it was about as clear as mud. But it should become clear in time. As the prose man wrote that entire section all on his own, I thought it was time we had a column devoted to doing what we set out to do — is to teach others to program a computer. To this end, I have chained him up outside and taken over. I will cover a few subjects related to the branch instruction, some more on computer arithmetic, and an introduction to the various addressing modes, or ways of accessing information, that the processor has.

First I suspect that was all one time regarded as the most important in computer science, that of decimal representation of numbers. It is possible, and indeed most

efficient, to work entirely in binary, but remember that other people will be using your programs when they are finished, and there are very few businessmen, shopkeepers, personnel managers, (or, in short, people) who are fluent with the binary number system, so any numerical results from a program must be displayed in decimal. The most efficient method of doing this depends on the application of the program. For a program with a lot of calculations and little result display, it is most efficient to hold the numbers internally as binary, and convert them to decimal when they are displayed. This is quite straightforward, and we will present a routine to do so later.

There are other cases, though, where this will not be the most efficient method, in terms of speed if not storage. If a program is

doing a lot of displaying of decimal numbers, but very few calculations, as is the case number of databases currently in use, it may be easier to store the numbers as decimal. Yes, I know we are not supposed to be able to do that in a binary computer, but this is where we start to cheat slightly (but only slightly), and introduce a new concept called Binary Code Decimal, or BCD for the kids out among us. BCD is very simple in principle, and is in fact not dissimilar to how in practice.

Binary code decimal

Just as, in hex, each nibble represents one digit between 0 and F, in BCD each nibble represents a digit between 0 and 9, it is therefore fairly easy to see that a single byte is limited to a maximum value of 99.

This is no problem, because we can easily string together as many bytes as we like. When it comes to displaying the number, it is fairly simple to mask off the relevant nibble, and display an ASCII character. We will be presenting an article in the not too far distant future with a collection of small but useful routines, and this will hopefully include a test of BCD arithmetic subroutines (if I get round to writing them . . .).

There is a slight variation on the BCD principle which I have never seen anyone else use, which is to have just one digit per byte. While this takes up twice the storage, it does allow for very fast addition, subtraction, and display, and the digits can be held as ASCII (00H to 09H) rather than straight binary, allowing the display routine to simply copy them directly to the screen. This is very useful for applications like game score displays, although not so good for general calculations.

Another problem with conversion from decimal to binary is that of negative numbers. Negative numbers are often taken for granted, but they are in fact one of the most abstract concepts employed by the human race. Abstract concepts and computers normally mix like oil and water, but for once there is a reasonably easy solution to the problem.

If we consider a single word within the computer (although the principle applies across the board), we would normally expect to be able to hold a number found to 65535 (a number that will fairly soon be displaced on your memory).

Negative numbers

If, on the other hand, we sacrifice the most significant bit (the left-hand one) to represent either positive (set to zero) or negative (set to one), we end up with a range from 32767 (7FFF or 0111111111111111) to -32768 (8000H or 1000000000000000). This we have already touched on, and is fairly straightforward. What is a little less obvious is how to convert from negative decimal to binary and back again. For example, how about -50? It is actually a fairly simple process. First, convert the number to binary, ignoring the minus sign. This gives 00110111, using a byte, so it means less typing. Next find the one's complement of this number (in other words, convert the ones to zeros and vice versa). This is easiest done in assembler by exclusive-oring with FFH, giving 110011110. Then add one, giving, in this case, 110011110. This, I sincerely hope, is the binary equivalent of -50. To convert back, the process is exactly opposite.

Now a quick jump back to the test of branch instructions. Normally, branches the method outlined above for negative number, using the byte following the branch as an addition to the current PC value, giving a range of 127 to -128 bytes (66 from the start of the FOLLOWING instruction). There is a special case, however, whereby the branch is prefixed by the letter L, making it a long branch. The range is now 32767 or -32768, or, in other words, the entire memory map. This applies to any

branch instruction available. Do not lose any sleep over calculating lengths of offsets for branches, because (a) it will make no difference if a long branch is used for a jump of 10 bytes, except using up an extra byte of RAM, and (b) the assembler will pick out any short branches that should be long branches. As a rule of thumb, use short branches throughout, and change any that the assembler throws out to long branches.

Now, after that nice easy start something to get you thinking (maybe . . . I was not thinking when I wrote it). Addressing modes. Just those two words have been enough to make strong men weep, although it is in fact a fairly simple subject. It will cover the basics this month, and get more complex as and when we use them in routines.

Addressing modes

The addressing mode of an instruction is used by the 6809 to determine where to pick-up or place the data for that instruction. The 6809 has a larger and more complex range of these modes than almost any other chip, bearing some of the bigger sixteen and thirty-two bit monsters. I will cover each mode and its uses, although not all instructions can be used for all addressing modes. As we cover each instruction, the range of available addressing for that instruction will be given. The addressing modes are as follows:

Inherent Not an addressing mode as such, this means that all necessary information is included within the instruction itself. This covers instructions like INCA, which adds one to (increments) the A register.

Immediate In this case, the required data is taken from the byte (or word) following the op-code. This has the advantage of speed of execution, as the source address has already been calculated, and is in the PC register. This is common to most other processors, but, as we will cover later, the 6809 is unique in allowing the programmer to access these address calculations, and use them to produce TOTALLY relocatable code and data (try that on poor 6800's). This can be fairly complex, so we will devote an article to it. In assembler source code, immediate data is always prefixed by the # symbol, as in ADDA, #10, which adds ten to the A register.

Extended (or absolute) Possibly the most commonly used mode, this uses the word following the op-code as an address from which to gather the data (or as an address to which to write the data). In the source code, this is shown as a number with no prefix, or, more commonly, as a label. (For example, LDA 32767 would load the A register with the value stored at address 32767, but LDA SCORE is much clearer. SCORE having been previously defined by use of one of the assembler directives that we might cover next month.

Direct This is much the same as Extended, but uses a single byte following the op-code as the low byte of the address, and the contents of the DP register as the high byte. This is quicker to execute, and takes up a byte less storage, making it ideal for

applications where there is a lot of data in a 256k byte area. Can be tricky making sure the DP register has the right value without wasting more space than you save.

Relative Used (to the best of my knowledge) exclusively for branches, jumps and calls, relative addressing uses the contents of the byte or word following the op-code, plus the contents of the PC register, to calculate the address, which is normally then transferred back into the PC register. Again, this can be used to make code totally relocatable, but more of that later. At the source code level, this simply means that all that is specified is the target address, and the assembler will calculate the offset needed.

Indexed Again, with indexed addressing, the 6809 stands head and shoulders above a lot of other processors, in that it has two sixteen bit index registers, allowing access to the entire memory map without having to worry about base addresses. With this mode, the processor calculates the address from the word following the op-code, plus the contents of the specified index register (either X or Y). For example, LDA 1000, X will, if the X register contains 24, load the A register with the contents of location 1024, or the first byte on the test screen. This is itself is very handy, but there's more! If the register name is preceded or followed by either one or two pluses or minuses, the processor will use either auto increment or auto decrement modes, which means that, for example, LDA 1000,X+, will, if X contains 24 as previously, load the first byte of the test screen into A, then increment the X register, leaving it containing 25. Conversely, LDA 1000, -X will increment the X register first, loading A with the contents of the second byte on the test screen, and the X register containing 25. This is incredibly useful for accessing tables of information, clearing screens, and about a million and one other things.

Indirect When an indirect instruction is issued, the target (or source) address is the contents of the address contained in the word following the op-code. This is useful for things like tables of jump vectors. For example, a program might display a menu of options, each a number for the user, multiply it by two (as each address takes up two bytes) placing the result in the X register, and then use an instruction like CALL (IMPACT,X). Note the combination of addressing modes here. This is actually indirect, and the combination of modes can get quite stunning, as it is also possible to use auto increment at it. Indeed on its own is not much use, although it is possible to find situations where it could be used. However, for such a situation, it is generally possible to find a more efficient method of gaining the same result.

Well, that about wraps it up. Sorry about the lack of assembler directives (again!) but they are coming soon. Next month, among the excuses for the lack of assembler directives, we (yes, we — Jason) will be working again if I can think up a five-thousand threat will cover some more computer arithmetic.

Dragon dialects

Brian Cudge grabs his phrasebook and learns to parlez Pascal.

IN THIS new series of articles we will be taking a look at some of the various languages available to the Dragon computers, at alternatives to the built-in Basic.

This month we start off by looking at the language Pascal. For the purposes of this article I used Lucinda Pascal from Compuserve which runs under the Plus operating system. Pascal was developed as a general purpose educational language by Nik Wirth in the late 1960s. With extended Pascal to be used to teach structured systems programming and hence the basis of the language is reflected in the style of programming.

The "Basic" approach to programming — that is given a problem, sit down at the keyboard and write a program, attempts to solve the problem by a mixture of inspiration and a lot of trial and error. While this approach can work for relatively very simple problems, it is entirely inadequate for finding solutions to programs of any real complexity. What is needed is a systematic approach to the problem, breaking it down into smaller and smaller steps until each step has a straight forward programming solution. This, basically, is the theory behind "structured programming".

Before diving into the details of the language, take a look at the (very simple) complete Pascal program shown in **figure 1**.

Basic structure

This shows the basic structure of a Pascal program. In this example, I have shown Pascal commands in uppercase and variables in lowercase for clarity — Pascal makes no distinction between upper and lowercase (although Lucinda Pascal does have the facility to do this).

The first line in a Pascal program always gives the name of the program (second optionally followed by the files to be used — here only the default keyboard and screen are used (Input and Output). Following this come constant, type, variable, procedure and function definitions. In the example program there are no constants, procedures or functions so only the variables used need be declared after the "CONST" command. Variable declaration before use is an important element of structured programming, implicit declaration is not allowed. We shall see later that there is a lot more to Pascal variables than it at first may seem.

Programs are made up of "blocks" of code — the whole program is the outer, top level block, next come procedures and functions, followed by procedures within procedures and so on. The lowest level block is an actual series of statements enclosed between the keywords "BEGIN" and "END". Pascal does not use line

```
PROGRAM Factors (INPUT,OUTPUT);  
  
VAR number, divisor, remainder : INTEGER;  
  
BEGIN  
  WRITE('Enter a number between 2 and 999: '); READ(number);  
  WRITELN; WRITELN('Factors of ', number, ' are:');  
  remainder := 0;  
  divisor := 2;  
  WHILE divisor <= number DIV 2 DO  
    BEGIN  
      IF number MOD divisor = 0  
      THEN BEGIN  
        WRITELN(divisor, ' ', number DIV divisor);  
        remainder := remainder + 1;  
      END;  
      divisor := divisor + 1;  
    END;  
  WRITELN;  
  IF remainder = 0  
  THEN WRITELN(number, ' ', divisor, ' found')  
  ELSE WRITELN('No divisors found - ', number, ' is prime')  
END;
```

Figure 1: A simple Pascal program.

numbers and the semicolons are only used to separate commands for the compiler (they are not the same as colons in Basic). Therefore, with an IF-THEN for example, if more than one command follows the THEN part then they must be enclosed in BEGIN-END as shown in the Factors program.

Block nesting can be taken to as high a reasonable level, in this program there are only three levels — the main program block, the WHILE loop block and the IF-THEN block. Blocks can be thought of as representing the simplification of a problem into smaller and smaller parts.

Anything to declare?

Pascal is an example of a "strongly typed" language. What this means is that all variables must be declared together with their type before being used. Operations that can be performed on one type cannot be performed on another. Special exceptions to this are the so-called "overloaded" operators (such as "+" and "=") which can operate on a variety of types (such as integer and floating point).

Basic has only two built-in types, these are numeric (floating point) and string (character). Pascal has 4 simple types built-in, these are "integer" (16-bit numbers), "real" (floating point), "char" (single sized character), and "boolean" (true or false).

Lucinda Pascal also has the additional simple types "byte" for byte integers and "aria" for a string of eight characters. For efficient programs it is obviously necessary to use the most appropriate "type" of variable, integer arithmetic is a lot faster than using floating point for example.

Define your types

As well as the simple built-in types, Pascal allows you to define your own types to a limited extent. Often it may be necessary to deal with entities in programs (such as colours for example). In Basic we might use a series of variables assigned: RED=1, YELLOW=2, GREEN=3 and so on. Then within the program we can say IF PAINT=RED THEN... This is an example

```
CONST MAXCOLOURS = 25;  
      MAXORDERS = 250;  
  
TYPE name = PACKED ARRAY [1..MAXCOLOURS] OF CHAR;  
      order = RECORD  
        maxorder : name;  
        position, quantity : INTEGER;  
        price : REAL;  
        stock : BOOLEAN  
      END;  
      daybook = ARRAY [1..MAXORDERS] OF order;  
  
VAR maxdependencies : daybook;  
      ordfile : FILE OF order;
```

Figure 2: Pascal type definitions.

of an "enumerated" type in Pascal. The equivalent would be declared as:

```
TYPE COLOURS = (RED,  
YELLOW, GREEN);  
VAR PAINT : COLOURS;
```

The advantage in Pascal is that the variable "paint" can only take the values red, yellow and green and not just any numeric value as in Basic. Also you are prevented from performing arithmetic on enumerated types.

Record definitions

Pascal, like Basic, has multidimensional arrays of any type. Unlike Basic the array is not the only data structure available to us. One of the most powerful features of Pascal is its "record" definitions. A record is a data structure consisting of a fixed number of components of various types. For example, if we needed to deal with "customer orders" which consisted of customer name, part number, quantity, price etc. Then in Basic the only solution would be several arrays such as NAMES, PART, QUANTITY etc. In Pascal a record type could be defined followed by an array of these records. Figure 2 is an example of this type of definition, which also shows the use of constants in definitions.

"Order" is defined as a record type which consists of the elements mentioned previously. The type "Daybook" is then defined as an array of order records. Note that type definitions do not declare variables, only types of variables — it is then necessary to declare a variable such as "todayorders" of the type "daybook". "Order" declares a list type consisting of orders so that todayorders may be read and written to disk as whole records.

To access a particular field of a record we use, for example:

```
todayorders[5].partno := 88;
```

That is, the record name followed by a subscript, followed by the field name, some versions of Pascal allow the following type of command:

Figure 2: Variable scopes and bindings.

```
PROGRAM EX1;  
  
VAR main : INTEGER;  
  
PROCEDURE p (param1:INTEGER);  
VAR localp : INTEGER;  
  flag : BOOLEAN;  
  
  PROCEDURE q (main:INTEGER);  
  VAR localq : INTEGER;  
  BEGIN (* q *)  
    main:=789;  
    localq:=1;  
    localp:=10;  
  END;  
  
BEGIN (* p *)  
  q(flag);  
END;  
  
BEGIN (* main program *)  
  main:=10; printa;  
END;
```

```
WITH todayorders[5] DO BEGIN  
partno:=88; price:=1.08 END;
```

This saves the programmer from having to type todayorders[5] before each field name of a particular record. Although this is a very useful function, Lucidata Pascal does not support it.

As mentioned earlier, Pascal is a block structured language, hence procedures may be declared and may be nested. The Basic "GOSUB" can be thought of as a very simple equivalent to the Pascal procedure. I will only deal with procedures here, but Pascal functions can be thought of as procedures which return values — procedures are called as expressions; $X:=F(X)$.

In Basic, a variable may be used at any point in the program and there is only ever one "version" of a particular variable. In Pascal, variables (or more formally "identifiers") have what's known as "scope", "binding" and "environments". A procedure may use its own variables which are not accessible by any other part of the program and whose values are not kept between calls to the procedures, these are known as "local" variables. Local variables may have the same name as variables in the main program ("global" variables) or as local variables in other procedures. Pascal allows recursion by the use of local variables — a new version of the variables is instantiated for each recursive call of the procedure.

The "scope" of a variable is that part of a program in which it may be accessed. When a variable name appears more than once, for example as a global variable and a local variable in a procedure, it is said to be "bound" to the current block. The variable exists only as long as the block in which it is declared is active. The environment of a block is the surrounding blocks in which it may access variables. The environments of all procedures include the main program (as this encloses all procedures) and also includes any procedures which enclose the procedure in the program text.

To clarify all this, take a look at Figure 3, this is a completely useless Pascal program, but demonstrates the various scopes etc. of variables.

Binding declaration

Here the variable "main" is declared as a global integer variable and as a local (scoped) variable for the procedure "Q" — it is declared as the parameter passed to "Q". Hence, when the procedure "Q" is entered, "main" receives a new "binding" to the scoped value and the global value of "main" cannot be accessed within "Q". When "Q" ends, "main" restores its binding to the global integer value.

"Local" is a local variable of the procedure "Q" and so cannot be accessed by any other part of the program. Similarly, "localp" is a local variable of procedure "P", but as procedure "Q" is environment includes procedure "P" (it is enclosed by it) it may access P's local variables. Notice that the main program cannot procedure P, but cannot call procedure Q directly if

surrounds P, but does not directly surround Q.

All this binding, environments and scopes may seem confusing at first, but with a little practice you'll wonder how you ever coped with Basic's variables.

I can only begin to touch on some of the many features of Pascal in an article of this size, there have I been born to mention the "heap" and pointer variables, but it is worth mentioning some of the particular features of Lucidata Pascal. Programs are written as standard text files onto a Flex disc, then compiled into a "P-code" binary file. P-code is an opcodes for a theoretical computer which the runtime program interprets and executes. The result is an impressively fast program which is stored more compactly on disc than stand alone machine code. My only complaint is that the compiler does not recover well from program errors when compiling; once the initial error has been reported a large number of spurious error messages may appear before the compiler gets back on the "right track". There are plenty of standard methods for error recovery in compilers (such as Turing's Algorithm) and it's a pity that Lucidata do not seem to have used one.

Lucidata Pascal

Lucidata Pascal has a number of very useful string handling procedures predefined for the programmer (strings are traditionally the most weak area of Pascal as well as some sophisticated file handling commands to access both sequential and random access files etc). A particularly very useful feature is the "overlay" procedure which allows very large programs to be run by swapping in and out blocks of code during execution.

The accompanying manual gives a summary of all the features available and plenty of detail on non-standard additions to the language. There is also a large section on the internal implementation of the software to allow you to customise the run-time system by adding new built-in procedures (commands) etc. This section is certainly not for the novice and some knowledge of compiler construction is useful here.

In all important respects Lucidata Pascal conforms to the ISO Pascal Standard and most textbook programs will run without change. A number of demonstration programs are included on the disc, these are all fairly elementary but do demonstrate some of the unique features of the implementation.

If this has whetted your appetite for more then there are plenty of books to be found on the Pascal languages. A few of the better ones to look out for are as follows: PASCAL, An Introduction to Mathematical Programming by Fredrick and Wirt. PASCAL User Manual by Jensen and Wirt. Programming in PASCAL by Peter Grogono.

System used: LUCIDATA PASCAL from Compuserve — 286.
Requires: PLUS operating System (B4F — minimum 1 Disk Drive).

If you've got a technical question write to Brian Cudge. Please do not send a SASE as Brian cannot guarantee to answer individual inquiries.

Dragon Answers

THE CHANGE of style this month is not a new format — it's thanks to the Pacific, who seems to have consumed Brian Cudge's column. Brian's faithful Dragon caught up another copy of Dragon Answers, but not copies, alas, of the original questions. Brian has written a summary of the questions from memory — we hope you recognise your own problems!

Here on 8279 514895, they can supply Dragonites compatible controllers for CIO.

Delta DOS

I HAVE a Dragon and Delta DOS and have transferred much of my software to it. However, some games will not run if Delta is attached even though I can load them from disc and then relocate them. Is it possible to switch out Delta so the software has loaded from disc?

Andy Palmer

IF YOU add the following lines of assembly language to your routine to relocate code it should allow most programs to run so if Delta Dos was not attached.

```
LDX =#0F53
STX 334
LDX =#0180
STX 372
LDA =#7
STA 373
```

What this does is to reset the interrupt vectors and also stops Delta from intercepting commands.

Interface

I'VE recently obtained a Tandy Color disc drive and interface. Unfortunately, the interface does not seem to work with my Dragon. Is there a simple way of making it compatible, and if not where can I get a suitable controller?

Adrian Richery

THE TANDY disc interface is certainly not compatible with the Dragon and there is no simple way to remedy this. You would have to change the ROM software to operate the cartridge with the Dragon.

However, Tandy disc drives are otherwise standard 5-inch drives and can be used with any suitable Dragon disc interface. Try contacting PNP Communica-

Extra RAM

I HAVE had a Dragon 64 for a couple of years and would like to know if it is possible to use the extra 32K of RAM to store graphics screens, when in 32K mode (with Dragonites).

Is this possible from Basic as I am a complete novice when it comes to machine code?

Gary Bell

TO USE the extra RAM for this purpose is not possible directly from Basic, however the program listed below will allow you to save and retrieve screens using the USR command from Basic.

The routine automatically looks at the current graphics mode — when it starts and how much RAM is used and transfers this to the extra RAM at the offset given in the USR command. USR is used to store the screen, USR+1 retrieves it. There's room for 5 PBOKE 3-4 screens or 10 PBOKE 1-2 screens or a mixture of both. For example, to save a screen on display, at an offset of 8K, in the extra RAM use 8-USR(8)(144), then to retrieve it later use 8-USR(1)(144). The offset should be in the range 0 to 20480.

```
10 GOTO LOAD GRAPHICS FOR 80K
20 CLEAR 280-32768
30 FOR I=32768 TO 32768/640
  40 PBOKE I/640-1 AG=POKE I/VAL I/64 I AG=NEXT
  50 GET USR=32768/640 I GET USR=32768
```

```
60 DATA 80, 10, 40, 40, 47, 80,
  10, 90, 87, 25, 73, 87, 77,
  00, 10, 87, 30
70 DATA 80, 80, 8, 80, 47, 80,
  10, 90, 87, 25, 73, 28, 80,
  80, 80, 20, 80
75 DATA 80, 17, 87, 10, 80, 80,
  10, 10, 87, 77, 87, 30
```

Graphics

I HAVE been mucking about with the Dragon's semi-graphics mode. Could you please tell me how I can implement these modes while using my Corona drive without corrupting the disk workspace.

J. M. Paster
47 Exington Road
Barbary
Dun
SE16 8AL

THE easiest way to set up the start address of the screen display is to use the normal Dragon Basic commands PBOKE and SCHEM, followed by poke to set up the semi-graphics mode. For example, to set up mode 24 starting at the first graphics page you could use the following lines:

```
10 PBOKE 4,1:SCHEM 1,1
20 PBOKE 80000, (PBOKE 80000) AND 3)
```

New line

I HAVE recently obtained a printer for my Dragon computer, but when I list a program all I get is a one long string of output — how can I make the printer start a new line at the every listed line?

K. Mogg

THIS question appears more regularly than most others (it's more popular than the 'speed-up poke'), but is worth repeating

occasionally for the benefit of new readers. The solution is to type the following immediately after powering up your Dragon:

```
PBOKE 150,80 for 40 — number
chars per line)
PBOKE 320,320/PBOKE 320,3
```

If this causes a blank line between each listed line then miss out the PBOKE 320,3. If this still doesn't work then PBOKE loc 320 with your printers' code for carriage return and loc 330 with the code for linefeed.

Routines

I AM trying to add some new commands to Basic and want to make use of some of the routines in the Delta DOS ROM. Can you tell me where I can obtain details of these routines?

K. McCordish

TO MY knowledge the routine documentation for Delta/Domains DOS has not been published and I have very little information on this DOS. Perhaps one of our readers has worked through the ROM and could help Mr McCordish?

'Windows' solution

OVER a year after the 'Dragon Windows' program was published (July 1985) I am still getting letters about it so can I take this opportunity to answer all the queries in one go!

Due to a minor bug in the listing the program may occasionally crash on some machines. The solution is to add the following line to the Basic loader program:

```
5 PBOKE 31814,140
```

'Windows' cannot be used in BASIC mode on a Dragon 64 as it uses a number of ROM calls, but will operate in 32K mode. Finally, many people have asked about using the software with Dragon-60. There is no simple way of changing the loader to operate with Dragon-60; a disk version has been written but this is a completely rewritten version and is not due to be published in Dragon Men.

Screen Designer

Dennis Riley text, colour and graphics to create designer screens.

THANKS TO ALL of the recent articles on machine coding, in particular the "Fireware" series, in *Dragon User*, I now find that programs in machine code are getting easier to write successfully. However, this left the problem of wanting programs to Auto-run, fortunately solved by Brian Cudge (*Dragon Answers* Aug '85), and to displaying a customised screen while loading. Hence Screen Designer.

Screen Designer allows a text screen to be built up using all of the graphics characters, colours and the majority of the text characters (some are used as function keys). A screen may be saved and re-loaded so that it may be re-used or modified. Text, colours and graphics characters can be edited and manipulated on screen to produce the desired effect. A program can be saved and made to Auto-run, displaying the screen created, and the program executed, in that pressing RESET will re-execute the program.

Entering the program

Two methods to enter the program are given. **Listing 1** gives a listing of the machine code which can be copied into memory, using the Basic loader provided (**Listing 2**), which will allow you to enter the code in stages. Just enter as much as you like, and **SAVE**, then an **Alt-Starting** **CLDMM** and continue from where you left off.

Listing 3 gives the Aldreem assembler listing. It will be noticed from this listing that the program starts with a short piece of code which relocates the program to its workspace at loc 30001, this has been included as an example, the need for which will be given later.

When the program has been successfully entered save the program using:
SAVEM "DESIGNER", AH0000, AH0001, AH0000

The program can now be run using
LOADM "DESIGNER", EX00

Program operation

On running the program a Menu of options is given.

1) **Create Screen** This option is used to build up the required text screen and uses a number of function keys. On entering this option you will be faced with a green screen with a flashing cursor in the top left hand corner. Green is the default background colour (this is Graphics Green Code 145 and not text Green Code 325, this colour can be changed using the "B" key, by pressing the "B" key the colour will change for each press, and with the exception of the black screen a cursor will again appear, when text or a character is entered on to the screen or the cursor is moved.

The cursor can be positioned anywhere on the screen, without destroying existing text or characters, by using the Arrow keys.

Auto-repeat is incorporated into the program to facilitate movement of the cursor and entering text or characters.

Text can be entered on to the screen as normal and deleted using the **CLEAR** key, it will be noticed that both the **CLEAR** key and **SPACEBAR** take on the background colour.

Graphics Characters are placed on the screen, under the cursor, using the "a" key, repeated pressing of this key will change the character shape.

The colour of the character under the cursor can be changed using Shift "B", again repeated pressing will change the colour, and the selected colour will remain in operation until altered.

Both the character shape and the colour are stored into memory, and can be repeated any where on the screen using the "u" key, hence the auto-repeat makes light work of borders, though these are best left until last.

To help in the design of the screen there are six scrolling functions, the Shift arrow keys will scroll the whole screen in the appropriate direction and by using the "<" and ">" keys the individual line containing the cursor can be scrolled left or right.

Colour

The colour of all of the characters on screen can be altered using the "B" key, without affecting any text. However, as the colour of the space and dots will still be the original background colour, the use of this function is best left until a screen is completed.

The first function uses the "N" key and this will input the character under the cursor, to colour characters not normally available from the keyboard, i.e. inverse numerals.

The **BREAK** key will return to the Menu, and as the screen is saved to memory, obviously any previous screen will be lost.

2) **Display Screen** This option will display the screen held in memory, either one that is being worked on or one that has been loaded into memory. All of the described functions apply to this option.

3) **Save Screen** Here a screen can be saved to tape, and therefore a library of screens can be built up, or an unfinished screen can be saved for future work to be done on it.

4) **Load Screen** Loads a previously saved screen back into memory, together with the original background colour and the text character colour used, for use with the spacebar and dots.

Options 5 and 7 turn the motor on and off respectively, this is to allow for the clearing and/or positioning of tapes. The **BREAK** key used from menu will return to basic.

Auto-running

Option 5 will convert a machine code

program into one that will Auto-run and will display the screen chosen while loading. There are, however, some very important conditions which must be met for this to be successful.

The source program must have been saved using
SAVEM "TITLE", N1, N2, N3 where:

N1 is the start address of 5H0000. Programs must start at this address. Any program needing a higher workspace can be relocated using a similar method to the example given.

N2 is the end address of the program while in the graphics area.

Most importantly N3 is the address from which the source program is to be executed (**EXEC**) when it is in its required workspace, even if this means that the **EXEC** address is higher than the end address, if N3 points to some other address it may result in the program crashing, and pressing reset, instead of re-executing the program will certainly cause it to crash. Ideally the **EXEC** address (N3) will be the same as the address **JMPD** to it in the relocation program. Of course if the program is to remain in the graphics area so much the better.

An example would be if Screen Designer itself were to be saved using Screen Designer.

Firstly the program would be loaded and executed, it is now in its workspace at loc 30001. However, as Screen Designer does not use Hires, the original program is still in the Graphics area, this can now be saved using:

SAVEM "AUTODESK", AH0000, AH0001, AH0001

If the program is now saved, using Screen Designer, it will Auto-run on loading.

As can be seen, from the assembler listing, the relocation of code is very simple for anyone using the Aldreem assembler. As there are two directives **ORG** and **PUT** which do the job for them.

Anyone referring to Brian Cudge's piece on Auto-running machine code will see that he has given a little piece of code that should start any auto-run program, with Screen Designer. However, this is unnecessary as this code is already taken care of.

The first piece of code at the execution address should be a **NOP**, this is so that if the reset button is pressed the program will re-execute, if a **NOP** is not present, a cold start will occur.

Option 5 includes prompts where the motor is turned on or off to enable tapes to be correctly positioned.

Hints and tips

Most of the code used in this program was gleaned from the pages of *Dragon User* at some time or another, particularly in

regard to logic instructions. (Bruce Decker O.U. Jan 1981).

The routine called, using the "B" key, loads each character in turn from the test screen into the A accumulator; a test character is by-passed but a graphics character has its value increased by 16, to alter its colour. The A accumulator is then OR'd with #126 (0000) to ensure that a graphics and not a test character results.

In Two's complement arithmetic numbers 0-127 represent positive numbers (as 0 is not 000) and numbers 128-255 represent

negative numbers (as 0 is not 00000000). Numbers 0-127 represent test characters, whereas numbers 128-255 are graphics characters. Therefore, by using TST and the conditional branches BMI and, as in this case BPL, it is possible to distinguish between graphics and test characters, and branch accordingly.

The previously described routine, if used as a subroutine, can do wonders for Mouses or any test page that is waiting for a prompt. Listing 4 gives a short example, a little

over the top, maybe, but it does demonstrate what can be done to liven up a screen.

All of the IO functions are from Brian Cudge's "Firmware Series".

Entering machine code, especially without an assembler, isn't de Mousous, so I will provide a copy of the program for Ed listed in Dennis Riley, 31 Colmore Road, Merton, Leeds LS2 4DP. I will answer general questions about the program, but please send a stamped, self-addressed envelope.

Listing 4: machine code test.

[illegible]

The Dragon makes more noise than you think, says Jonathan Bates

Unfortunately the designers of the Explorer's basic instrumented sled did not utilize the

Analogue port

Listing 3 extends the Dragon's insult found command and should be used in addition to the commands already used. It causes a note with different, busy harmonics and it can also be used com-

Sliding Graphics

Pam D'Arcy slips into something a little more BASIC.

PERHAPS it is a sign of the maturity of the Dragon and its users that these days "Dragon User" features an abundance of machine code articles and, excellent though they may be, programs containing really few dunks. However, I still come across many readers who are not interested in machine code and others who are put off by long listings, so once again I am offering a non-anale game of minimum length, written entirely in BASIC, capable, of your own enhancements to suit. DEM lines may be omitted for even faster completion. For those who like rather more than just a listing, some explanation of the Dragon BASIC graphics statements used completes the article.

Slide Puzzle Program (Listing 2)

The program takes the existing contents of graphics pages 1-4, copies them to pages 5-8 where it treats them as a 4x4 grid as in a sliding puzzle, scrambles the 'tiles', then waits for the player to reconstitute the original picture by moving the 'tiles' via the 'blank' square using the arrow keys. Movement is as per the plastic puzzle, that is, a 'tile' is moved into the 'blank' space. There is an optional option (x) to allow the totally lost to start again!

Any existing PAGED screen may be used, although 'tile edging' and a contrasting coloured 'blank' square may need to be incorporated for easier operation. Instructions for doing this are detailed below. The 'default' position of the blank square is the top left of the screen. Meanwhile, a quick picture may be obtained from Listing 1.

A Picture Of A House (Listing 1)

I recommend that Line 540 is typed in first then to RUN the program after typing in each LINE/CIRCLE/PAGE statement which will show you the effect of each graphics statement and will confirm the validity of the statement as typed rather than tedious debugging after typing in the whole. When completed, delete line 540 if you intend to append Listing 2 to form a single program.

An Existing Picture

Any existing PAGED graphics picture currently in graphics pages 1-4 may be used. You may have one available from a graphics generator program, light pen or touch pad creations, from interrupting (BREAK-RESET) a game containing a nice graphics display or one designed and drawn up by yourself or your pen-mating.

If you do not have a copy of the screen stored on tape or disk, I recommend that as the first step so that it can be reloaded another time, including if it gets messed up following these instructions! If needed,

Table 1 offers assistance with saving and loading the graphics screen.

Listing 2 (comprising an edited LINE 50, new LINE 58 and existing LINE 5 440-540 of Listing 1) is a program that will show in the tile-edging and 'blank' square in the top left position of the screen. To change the blank's colour, the first parameter of the COLOR statements should be changed to the number of the required colour. To change the position of the blank square, the appropriate co-ordinates as given in Table 2 should be used in LINE 508. The default values for the position of the blank square in the Slide Program will need to be amended accordingly (see below).

LINE 50 makes a quick 'safety' copy of graphics pages 1-4 to pages 5-8 when RUN. Should you want to change something after the first RUN, a re-load of the original screen from tape or disk is unnecessary if you also edit LINE 58 to ... POOPY N=4 TO N ... to restore the original copy when the program is subsequently RUN.

Having set up the tile edging and blank square, save the masterpiece to tape or disk for future loading to use with the Slide Program.

Program Techniques

Various 'default' values can quickly be changed to suit your requirements. These are coded on LINE 600:

CS=colour set (when RUN, key C changes colour set anyway)
 DX, DY=default blank square
 co-ordinates of the 4x4 grid,
 0-3 across (DX) by 0-3 down (DY).

thus 0.0=top-left; 3.0=top right
 0.0=bottom-left; 3.0=bottom right etc.
 MV=value that is subject of RAND to determine number of the movements (when added to 8) to jumble the picture.

thus the initial default jumble is between 7 and 16 moves (I use MV=16 for my children).

The GET statement copies a described rectangle from the screen display into an area of memory called an ARRAY 'Sizable'. That Array Variable can then be copied into different part of the screen using the PUT statement. In the Slide Program, we need to swap the blank square 'rectangle' with an adjacent 'rectangle' of a 'picture tile'. The contents of the blank square 'rectangle' never change so LINE 740 copies it to the array 'BS' where it stays for the duration of the run.

The important thing about the size of the array variable for GET PUT is that the manual is wrong and greatly overstates the required size.

The width of the 'tiles' in pixel points for each of the four 'tiles' across the screen is 256/4=64 (variable PX). The depth of the 'tiles' in pixel points for each of the four 'tiles' down the screen is 192/4=48 (variable PY). According to the manual, this would require an array DIM \$\$(63,47) to store a copy of any of the 'tiles'. In fact, the graphics data is tightly packed into the array and a formula for calculating the required size that will work for all PAGED and GET PUT options is:

TABLE 1
SAVE/LOAD FROM/TO GRAPHICS PAGES 1-4

System	SAVE	LOAD

PS=Width of rectangle involved in
PIXEL POINTS

PT=depth of rectangle involved in
PIXEL POINTS

Then ARRAY VARIABLE size=INT (PWT
(PWT*PT)+7)/8+4/8)

Thus, typing in the Dragon the above
information in COMMAND MODE

PS=64 <ENTER>

PT=48 <ENTER>

PRINT INT(INT((PWT*PT)+7)/8+4/8)

<ENTER>

reveals a required Ddb Array size of 77 (as
even the BASIC00 slightly exceeds the
minimum requirement).

There is no harm in oversteering the
required size, apart from wasting memory,
but there is every harm in understating the
size. Also, unless the normal use of arrays in
BASIC where if an array that has not been
specifically DIMensioned is encountered,
BASIC automatically allocates a default
size of 16, the array MUST be defined in a
DIM statement as BASIC will flag an
ERROR and NOT define the array
ARRAY in these circumstances. The pur-
pose of the LD variable checked in line 820
is to avoid the start line move when jumping
the picture to simply mirror the previous
move, thus negating some of the effect of
the move.

The GETPUT subroutine in lines 1040-
1080 swaps the tile to be moved with the
adjacent 'blank' square. At this point, the
4*4 grid co-ordinates are held in MX and
MY for the picture tile being moved and BX
and BY for the current position of the 'blank
square'. First, the 'picture tile rectangle' is
GOT into the MY Array variable. The 'blank
square rectangle' copied into array variable
BS at the start of the routine PUT over that tile
on the screen. The 'picture tile rectangle' in
array MS is then PUT over the 'blank

square rectangle' but it is being moved to
the blank square co-ordinates as they
updated to its new position (line 1070).

Avoiding FC Errors

If the Side Program is abandoned by, say,
pressing BREAK rather than using the 'H'
option, and the next PCLEAR statement
used is other than PCLEAR0, error directly
from the keyboard or even in a newly
loaded program prior to a PMODE0 state-
ment being issued, an FC ERROR will
occur.

This is because the Side Program was
currently set to PMODE 3.5 thus using
graphics pages 5-8 and the BASIC inter-
preter safeguards the graphics pages
needed by the current PMODE setting. A
lower PCLEAR figure will not be allowed
until the machine has had its PMODE
setting suitably reset. Thus when the
program is quit through its in-built option
(*), the PMODE setting is set to the lowest
option requiring just one graphics page,
PMODE0.5 prior to the END statement line
990. The PCLEAR0 is reset to PCLEAR4
to release the unneeded 'working' pages of
the side puzzle, but retaining the 'master'
pages 5-8 intact in case the program is
re-RUN. A BASIC program is physically
moved down into the freed graphics pages
as soon as a lower PCLEAR statement is
issued; by exiting the program using the
'H' option, typing in PCLEAR1<ENTER>
from the keyboard then RUN<ENTER>.
The visible graphics screen corruption is
where the Side Program was moved to
following PCLEAR0. It is physically copied
to higher in memory when a greater number
of graphics pages than at present are
reserved with PCLEAR. It is quite a good
idea to commence graphical programs with
a PMODE0 so that FC Errors are avoided

when setting up graphics requirements
regardless of the state that a previous
program may have left the machine in.

Picture Programming

I have space rather longer than allotted on
the Side program so will just mention one
or two final points regarding the Picture
Program. In PMODE3, the size of the
colour unit is 2 pixel points wide by 1 pixel
point deep. The co-ordinates used are still
based on the highest resolution graphics
screen, being 256 pixel points across (and
192 points down). They are addressed as
0-255 and 0-191 respectively. If an odd
pixel co-ordinate is specified when refer-
encing a point across the screen (= X
co-ordinate), that co-ordinate has 1 sub-
tracted from it when accessing the screen.
That is, as in the program where on X
co-ordinate such as 255 is used (line 681),
the block of colour pointed in comprises the
next pixel points 254 and 255. The size of
the colour unit is why a STEP of 2 is used in
line 680.

LINE statements with no concluding B or
BF parameter result in a line being drawn
from the first pair of X, Y co-ordinates to the
second pair. LINE statements concluding
with a B alone means 'draw a rectangle
(Box) in outline only', the pairs of X, Y
coordinates defining the diagonally oppo-
site corners of the rectangle. The BF
parameter on the LINE statements means
'draw and Fill this rectangle (Box) with the
current foreground colour'. Only rectangles
can be automatically filled with colour.
Other shapes, such as the circle of sun-
shine and the roof of the house, need to be
PAINTed after drawing the outline. The
areas to be PAINTed needs to be completely
outlined with a defined single colour (border
otherwise the 'paint' will spread alarmingly)

Expert's Arcade Arena

Write to 'The Expert' at Dragon User
10-13 Late Newsprint St, London WC2E 9RF,
with all your arcade tips and hints.

GOOD DAY to you, all and welcome to the fourth arcade column and once again may I thank you for all the letters you have sent. I have thought a worthwhile to share them (with a few edits) for their safety. However, should you ever wish to see anything you send, the again please send an SAE, or alternatively leave ten thousand pounds in a hollow tree in Dagenham by Monday or I'll start sending them back. In bits. Heh, heh, heh.

Firstly the winner of a year's subscription is a Mr David Barclay of Dumfries, Scotland (you know, the party sat up the top with the haggis and the loche) who correctly named pictures (a) and (b) as 3-D Scudlab Attack and Hissie Goes (Swingingly). Congratulations David and tough (conceded) to the rest of you, especially those of you who can't spell. Scudlab.

Now then, moving at the speed of light on to Total Eclipse (which isn't strictly an arcade game but still seems to be the subject of several thousand letters to me) and two different ways of helping yourselves along with this game.

Firstly, you write to Eclipse-Pearson who expressed an interest in all the recent 5000 conversion. It selling board games for a couple of quid at various points in the game. This sounds to me like a pretty groovy idea but it's up to you to nag them!

If you don't feel like doing that then there is another solution. Over to J. Brown of Buckinghamshire with his 'Total Eclipse Savings Editor'. Mr Brown's program will only run on a Dragon 64 and as I only possess a Dragon 32 (unless any company out there really feels benevolent and wants to butter up a writer!) I have not tested it.

Mr Brown has sent complex instructions but the program is very easy to operate and they're not really necessary. Here are the prominent excerpts:

"The program only works on a D64 in 84k mode but can be typed in on a 32. Before loading however the 84k mode must have been selected. . . . For use with option 8, locations 32118 to 32122 for investing, 32104 to 32136 will change the number of shares, disks, and pills you are carrying. . . . Within option 8 'Q' returns you to the memory and 'B' will hold the listing or when held down make the listing slower. . . . The maximum number of credits is 42900007296. Any more and the program will crash!"

Thanks you very much, Mr Brown, some more Total Eclipsement month, now to The Dark Pit and the map from Simon Dickson. To be brutally honest I think that there is an error on this map as looking at it there seems to be no way to get to the exit, but my copy is mangled and so until my new one

arrives I can't tell it. However, rather than hold it back from you I've decided to go public to help the map and please, don't send me any more maps of this, or of Jet Set Willy as although the thought is very nice, they're no longer necessary! However, do keep sending maps of any game you have (JBooker Kingdom, anyone?), I have even given consideration to publishing maps of adventure games (look out Mike Goirand, this is a takeover bid) but please, please, please, if you email them returned make sure your name and address is on the map as well as the letter you send with it. Better still, keep a photocopy.

Moving on, an appeal now from Jonathan Harrop of Oxon: "In Time Bandit I have successfully completed 40 on 'The Time Gate' and have been returned to 1A, but I failed to do this on any of the other screens so I have not found out what the secret message is. I am now completely bored and thoroughly sick with this game. Can you please tell me what the message is?" Answers on a postcard to the usual address!

And so to a man who is becoming a co-writer on this column! Mr M. R. Vance who reliably informs me that his name is "Mick." "Mick the Brave" or "Mig Yoo" . . . doesn't explain the 'H' Mick! Still, Mick tells us that the access code for Beornstallor is

THE DARK PIT

MAPPED
by
SIMON
DICKSON

I HAVE to admit to being all at sea this month, and the blame for that has to go to Microdeal and their new adventure, *Aquanaut 471*, but more of that later. First to reader James Boyden and a query he's got on an adventure called ... wait a minute, *Aquanaut 4717*? Hang on, James, you might at least wait for me to review them before you start getting stuck in them. James wants to know where the seaweed is, I've had a mind not to tell him. (Those who said I've only had a mind anyway, kindly leave the page.) Have you encountered the Mubari yet, James? If you can't get past that bewitching go W-N-E-S (TO REACH THE SEAWEED) — and then you've got to know how to get it. SRETTUO TUALPHTM TI TUC.

Syzygy

James also wants to know how to get to the planet on Syzygy, the answer to which was given last month, but in case you missed it (how dare you!) you enter the co-ordinates then put the laser, the co-ordinates for the planet being 0-4-1-5 (and that's the right way round just for a change). Finally on *Water Factor*, how do you open the safe? You need an S&B to Tom Wilkinson of 13 Shalfleetbury Ave, Hail, Humberside, that's what. No, Tom isn't a safe-cracker, or at least I don't think he is, but he has just written to me claiming his *Dragon User* merit card for having solved Mister Factor.

Mr. A. M. Marks of 10 Molecombe, Farnwater, Croydon, Surrey NP44 4HE wants to swap or sell *Syzygy*, the *Hulk* and *21 Doctors*, if anyone is interested, while Alan (legible) Signature of Redbush, Cornwall wants to know how to pass the force field on the garden planet. A good job I know he means *Trekboar*, in which protection from the force field is given by TRLJUMA EHT.

A *Trekboar* tip from P. Sheppard of Chesham, for people wondering how to deal with the second spider. The answer: RECPHS DMOCES ON SI EREHT. To make sure of that you must deal with the first spider properly, and take it when dead to MOOR SDORACH XE EHT. This GDSG-TUC NOTTUS EHT ESSEPH. This reader also asks which *Dragon* adventures will also run on the Tandy computer, and I think it would be a good idea if we could compile a list of those for some future column, so

that all Tandy owners out there write it with a list of those *Dragon* adventures you know for sure will run on the Tandy, for the benefit of everyone.

Yet more help needed on *Trekboar*, this time by Adrian Hall of Huddersfield, and how to stop the Kendera flower from dying is the first question. Don't plant it too early in the game, Adrian, as it's almost the last thing you do. Secondly, how to get the ice to water the flower when necessary: TERNALB EHT NI TI YHRAC. In *Caverns of Doom* how to build the raft when you've got the logs, hammer, nails, saw and beams: EROH EHT DEENLUITS UOY. And how to explore underwater without running out of air: PU-N-HW-MANNO DO.

If anyone knows how to get over the oil fire on the third level of *The Plunderer's Adventure*, can they write and tell Stephen Heaton, 4 Bankcroft, Langton, Preston, Lancs-PN1 6AL, and Stephen also wants to know how to obtain food from the dinner clock in *Junglequest*, which is straightforward enough: 'DOOP IM EHT' DORD REHND OT YAS. You don't even need to say please.

Mr B. W. Le Roux writes to me on his flash Amstrad PCW from April Cottage, Cliff End Lane, Pott Leval, Nr Hastings, East Sussex TN35 6GF, and has come up with a potential money-making scheme. He says I should print pages of clues every month but make them coded instead of merely backwards — then I can make a few bob by selling the code-books. Nice thinking, Mr Le Roux, but I wonder if the new editor would let me get away with it? I can give a clue backwards, forwards, cryptic or in binary for this reader's problem in *Syzygy*, as he's blundered into a big forest where the light is a strange colour and he can't do anything. Can anyone shed any un-strange light on that problem? The same reader is also having light trouble in *Caverns of Doom*, wondering how to reach the broken lamp. He says he's tried using the oil to unstick it, the rope to improvise a walk, and has even taken the pickles out of the jar to try to put the lamp in there to shield it from draughts, but all to no effect. I'm not surprised, either. Why? EREHWESLE PMAL MEKORHNU NA SI EREHT. Why hasn't this adventurer discovered yet? It looks from the map as if he hasn't MOOR LLAMS EHT NI LLAW EHT DENNAXE. Mr Le Roux also offers help on Pettigrew's Diary: arrange a chess,

which not many people claim to have finished.

Where is the bomb hidden in *Mings of Mar*, asks A. Court of Birmingham, RAL-LEC EHT NI, page 1, where you go HTRON TSAD HTUCS HTUCS then R&M&TWOC XE with HCNHFW DMA MUBHMLA and finally TSAD DO.

All this backwards writing is taking its toll, so I'll give myself a break by looking at *Aquanaut 471*. Under the *Doomed Sea*, another of Microdeal's imported American adventures converted for the *Dragon*, and also available for the Tandy. This takes place in the 21st century, where Jacques Cousteau's vision of underwater cities has become a reality, and you play the part of a high-ranking member of the *Doomed* Federation. It seems France's trouble of 1918 isn't over, as that's where you're headed when the adventure begins. (Rough you won't know what the trouble is if you're contacted Huey-14, the *Dome's* service chroil, who sent out the SOS.)

You only have a limited number of moves to find the *Dome* when travelling around the various underwater scanners, but luck led me to it first time — bad luck, I think, as this then brings you to the first of what might be called arcade games, it involves had ever been so primitive. You have to use your joystick to manoeuvre your submarine across the screen through bubbles floating to the surface to reach the *Dome's* landing spot. It's awkward to do, and rather annoying if, like me, you'd been looking forward to getting stuck into a new adventure. Once you're through, be sure to save your game so you don't have to go through the silly game again.

Underwater city

Here the adventure proper does begin, and you can start to map out the underwater city, wondering what you do with the last pipe and the memory grid that you soon find. Not that you worry for long as, oh no, it's another arcade game ... just where I was starting to get interesting, too. This time you race your jet self up the screen through a maze past a series of moving robots.

I'm afraid I found these arcade elements tedious and disruptive to what would otherwise be a promising adventure with the high standard of moving graphics we've come to expect from the likes of *Trekboar* and

others. No doubt it will be popular with many of you, but it's not one I intend to load up too often. Let's see the mini-review with a clue, though. What to do with the foot-crest? **EWAT RCDL**.

Back to old favourites, and I don't mean O. Collins, of Biggleswade, but the adventure he or she is talking about. **O. Diablos**. What do you do with the desert bushes? **EWAT RCDL**. And with the seeds? **HTAP MATHEUR EHT NI MEHT TRALP**. And the rest? **SDAHEHT EHT EIMMAE**. And how to get back from the cave when you've cleaned yourself there? **BUKWA**. Help is available from this same reader on Franklin's Tomb, Mansion Adventure, Dragon Mountain, Calico Island, Don't Panic, Ring of Darkness, Mission I and Mystery of the Java Star, so **SAE** if you're interested to O. Collins, at High Road, Broom, Biggleswade, Beds SG15 9AL.

Envelopes

On the subject of stamped addressed envelopes, don't forget to send them if you're willing to anyone asking for help, and that goes if you're willing to risk and want a personal reply. No **SAE** means the query will get dealt with in the next available issue of the magazine, and depending on publication dates that could mean a wait of two or three months for you.

From David Wainman, a citizen of Wakefield, come several pleas, plus a map and clues on Dragon Mountain. To kill a demon in the other adventure: **RGOGAD RG OHCDS OCLAM EBU**. And the bit with LOO: **ONHTYUA HTW DEBPH EBNAC**. Amongst David's problems is the immortal in Sea Quest — well, I don't expect you come across many in Wakefield, do you?

So you wouldn't know what she wants. **ROHRM EHT**.

Anyone got a spare **PrMist**? Michael Higgins of 18 Medford Drive, Glasgow G14 8BT would like to play **Pinario** but can't get hold of copies, so if you've finished with yours and would like to sell or swap then contact Michael direct. Alistair Grant lives near Drosteich but is also looking for space in Lost in Space. He keeps getting caught by the security robot, but even when he manages to make it to the room with the gall he doesn't know what to do when he gets there. Use your head, Alistair, or at least that hole in the foot of it that you shovel food down. **EMV RG HYOPI EDRHT OWT EMO YAS**.

A letter has arrived from Michael Edwards, also Broomfield, to show that he doesn't just write adventures but solves them as well. He's sent in a complete solution to Black Sanctuary, so if anyone wants a copy of that just write in to me with **SAE**. Meanwhile here are a few of the

problems dealt with for you.

- 1) Can't get through the locked door? **TPOL EHT OT OG**
- 2) Can't pass corridor? **ENW EHT PORD**
- 3) Can't find music to play? **NARDA ESACROOD EPMMAE**

Michael has Franklin's Tomb, Pirate Adventure and Ring of Darkness, which he's like to swap for O. Diablos, Shenanigans, Sea Quest, Return of the Ring, Calico Island (graphics preferred), Lost in Space and Pinoy Business. Any offers? Write to 36 Broomfield, Welwyn Garden City, Herts AL1 1RP.

Finally a big thanks to Simon Hargrave of Gloucestershire for his solutions to Justaposition and Trekbook. I've already made the last one available to readers, so let's add Justaposition to the list of freebies, as well as Black Sanctuary. Don't say we never give you anything! I'll might even give you another adventure column next month, if you behave yourselves.

Adventure Contact

To help puzzled adventurers further, we are instituting an Adventure Helpdesk — simply fill in the coupon below, stating the name of the adventure, your problem and your name and address, and send it to Dragon User Adventure Help-

desk, 1213 Little Newport Street, London WC2H 9PP. As soon as enough entries have arrived, we will start printing them in the magazine.

Don't worry — you'll still have Adventure Trail to write to as well!

Adventure _____

 Address: _____

Adventure Contact

Adventure: Vortex. **Factor:** Problems: How do I open the safe? How do I unlock the door at the North? How do I get the Time Machine to work? **Name:** John Foster. **Address:** 94 The Oval, Fifth Park, Sheffield S5 6BP.

Adventure: Justaposition. **Problem:** Where is the Altar? On what and what is the use of the sword? **Name:** Paul Davidson. **Address:** 211 Dunnington Road, Gillyflower, Gillingham, Co. Antrim, N.I. BT34 5PP.

Adventure: Justaposition. **Problem:** How the ??? do you get past the Nighten Dred? **Name:** Bob Pelling. **Address:** 24 Wilmsley Close, Buckingham, Bucks MK18 7BH.

Adventure: 1) Strange Outcry. 2) Escape from Pulsar. 3) O. Diablos. **Problem:** 1) What use is the Rigidus Dia-ice House? Does the job ask help? 2) How do I make

the safe? How do I open the locker in the maze? How do I make a cake? 3) Where do I find the twig? I have already spoken to the wizard. **Name:** Peter Hennings. **Address:** 3 Ingolds Road, Weydon, Leicester LE8 1DG.

Adventure: Return of the Ring. **Problem:** Can't get books of skulls from Maford in forest room. **Name:** Mark Ryan. **Address:** 5 Sully Terrace, Penarth CF8 2DS.

Adventure: Syzygy. **Problem:** I can't find the telestation. I can't kill Vader. **Name:** Costas. **Address:** 115 Essex No. 145, 875 26024 Madrid, Espain.

Adventure: Trekbook. **Problem:** How do you get to the planet's surface? How do you see the dark room and how do you open the access panel? **Name:** Paul Ewart. **Address:** 1 Blarney Road, North Anson, N. Sheffield S20 7EH.

Adventure: O. Diablos. **Problem:** I have been everywhere I can, but I can't do anything. Help! **Name:** Jason Coomes. **Address:** 52 Springfield Avenue, Holbury, Southampton SO24 1LP.

Adventure: Return of the Ring. **Problem:** How do I kill the Gnome and the Trog? **Name:** Roger Pigot. **Address:** 27 Welbeck Road, Walsley, Sheffield S6 5AY.

Adventure: Justaposition. **Problem:** Where do I find the red ore? How do you get to move M.S. in Power Phant? Where do I find the space? How do I cross the river into Barni Blue's land? I need a red sheet and a map. **Name:** Michael Posing. **Address:** 52 Raymond Road, Bedminster, Bristol BS3 4QK.

Adventure: Justaposition. **Problem:** Cannot find the book. **Name:** James Weyland. **Address:** 5 Bedford

Court, Havertill, Suffolk. **Adventure:** Return of the Ring. **Problem:** How do you breathe on moon forest? How do you get his points and more points? **Name:** Ravi Lawton. **Address:** 3 Walworth Grove, Pinner, Middlesex, Uxbridge, Middx UB8 5NP.

Adventure: Jerusalem Adventure. 2. **Problem:** How do I get through the golden gate? What are the magic words? **Name:** Julian Griffin. **Address:** 1 Higgs Close, Rylands Hill, Leicester LE5 4LY.

Adventure: Shenanigans. **Problem:** I can't get the job into the cave. **Name:** Mark Middleton. **Address:** 22 Tenby Place, Deal, Kent CT14 9H.

Adventure: Temple of Vran. The Final Mission. **Problem:** Can't get past the security guard, or through the double doors. **Name:** Ian Hoole. **Address:** 20 Hatfield Road, Aberdeen AB2 6RQ.

Mini Maths

Gordon Lee sets the puzzles — but who will find the totals?

FROM TIME to time on this page we present a series of unrelated puzzles that the reader might be interested in tackling, purely for his (or her) own enjoyment. Here are five such puzzles, but the solver should proceed with caution as not all of them are necessarily solvable by the use of the computer.

1. Using each of the nine digits 1 to 9, once and once only, arrange them to form a perfect square. For example, one such arrangement might be 382945761, the square of 19569. There are many other arrangements of the nine digits possible, but can you find a) the lowest possible number, and b) the highest?

2. As in question 1, use the nine digits 1 to 9, but this time arrange them to form two nine-digit prime numbers: a) the lowest possible, and b) the highest.

3. A farmer has a circular field with a diameter of 300 feet. The field is enclosed by a fence. Inside this field he set to the perimeter fence is a goat on a length of rope. If the rope is long enough to allow the goat to graze exactly half the area of the circular field, how long is the piece of rope? (You should assume that the goat can reach exactly to the end of its tether).

4. The number 4 is very interesting. It is a perfect square, and the two integers each side of it, 3 and 5, are both prime. Can you find the next highest square number that has this property?

5. Consider the following alphametic:

DRAGON
USER

In alphametics, each letter represents a certain digit, whatever it occurs. Similarly, unlike letters represent unlike digits. So in the puzzle given we have a six-digit number with all digits different (as represented by the word 'DRAGON'), divided by a four-digit number, also with different digits ('USER'). Note however that the second digit of the numerator is the same as the final digit of the denominator, as represented by the letter 'R'. The result of this division is represented by the two asterisks. Of this number nothing is known except that it consists of two-digits, which may, or may not, be alike. However, if this value is cubed, and the digits of this cube exchanged for letters using the same substitution as in 'Dragon User', the result will be a familiar English word. Can you find the correct values of the letters and the word is produced?

For the competition this month, we require just the solution to this final question (No. 5).

The solution to question 1 follows, as if you wish to tackle it yourself, read no further. The solutions to questions 2 to 4 will be published next month.

1. The lowest and highest numbers are 138542769 and 923187456, the squares of

11826 and 96084 respectively. One method of solution is by running the program listed below. Here, the values in the range 11112 to 21428 are squared and the resulting figure is tested to determine if it is a compound of the nine digits, 1 to 9. In order to do this, the numerical value needs to be converted into a string variable so that individual digits can be selected for examination. Note the second comment in line 30: `55=mid$(55,2)` which removes the first character of the string. On the 'Dragon', as on some other machines, when a numeric variable is converted to its string equivalent, an extra 'invisible' character appears in the first position in the string. This character holds the imaginary plus sign in front of all positive numbers. (If the number were negative, the minus sign would appear here, as we would expect). Consequently, we need to remove this extra character from the string, before examining its contents.

Having done this, the remaining nine digits need to be tested to determine that there is no zero present, and that no digit is duplicated. The test for duplication is not difficult as every character in the string can

be compared with every other, but it is time-consuming to test every one of the possible squares in this way. Fortunately there is a short cut available. In any arrangement of the digits 1 to 9, the sum of the digits must equal 45, and the product must equal 362880. Consequently, it is simply necessary to move along the string taking each digit in turn and finding the respective sum and product. Any value not in agreement with the expected values can be rejected. Note that this procedure will not guarantee that every number which passes the test does contain the nine digits, but it will reject all those which do not have sums of 45 and products of 362880. If the listed program is run it will print out all 30 squares which are made up of the digits 1 to 9, but it also includes a further two containing duplicated digits. However, these are easily spotted and can be eliminated. Note that the question, as stated, only asked for the lowest and highest values, so if it is suit until the first answer is printed (the lowest value), and then line 10 is amended to: `10 FOR N=21428 TO 11112 STEP -1`, the program can be rerun to compute the highest value.

Prize

Guess what we've got this month? A real tuck-in for the bookworms. For those of you who welcomed your chance of getting a long-free copy of *Total Eclipse* sent (sped of light) to one against *Eclipse-Festiva* are looking their complete confidence in the

1.3 version by sending us here 20 copies for our August prizewinners. Our man on the spot (listed above: *Total Eclipse* ... reads of *Traveller* caved in frustration when the Universe looked up a thousand light years from home. Now it seems that the Universe is rolling again.

Rules

To solve this puzzle and win a prize, you must give the answer and show how you arrive at it, using a Babbage program. Don't send cassettes, just a printout, and any explanation you want to offer (and our kids to support won't be accepted). Please mark your envelope **AUGUST COMPETI-**

TION, and don't forget to put your name and address on your entry and send it to reach us by mid-September at the latest.

This month's prizewinner, complete the following phrase: "You'll never score in the Universe: ..." It can be a lineolite if you mean — just so long as it begins "You're never alone in the Universe: ..."

May Winners

Our trusty trophy drawer this month contains 20 copies of *Elo's* hit *Kung-Fu* — The Master, and these are on their way to: J. B. Slinger of High Wycombe, Andy Beale of Warrington, Phil Sapota of Liverpool, E. C. Harriest of Ebbw, D. C. Lee (not the Geo C. Lee) of Barnsley, J. L. Clark of Portsmouth, Ralph E. Newman at Penrith, S. P. Hope of Rotherham, P. D. Macdonald of Tipton, Simon Aubrey of Bealton, D. A. Hunt of Canterbury, G. R. Barber of Sutton Coldfield, E. A. Newman of Addlestone, M. W. Stanton of Tewkesbury, Mark Heaps of Warrington, P. A. Derrington of Stock, P. Fairclough of Wrexham, M. C. Rogers at Feltham, E. K. Jones of Cardiff and D. C. Paulsen of Potsgrove.

Solution

Many calculated correctly that 5 to the power of 36 is 100144276840626546171649568... but not everyone remembered to say that the odds involved are either 1 in ... 055 or ... 055 to 1. Prizewinners 'drew' heavily on *Unearthed Dragons*, but the Editor's favourites 1 get a look out of my *Dragon*, because it's perfect for 'whatever ju da'. Quah!
